

VTEQ is geared toward the development, production, supply and servicing of the highest standard of Vehicle Testing Equipment. Our expertise in this industry has put us in good standing and having a European partner backing up our service to the European Standards we are sure that our quality is the best in the country. We deliver outstanding service and maintenance to our cherished South African and international clients. We pride ourselves on quality, performance and being the leaders in technology.

## **Looking to the Future**

Mr Moosagie and his board have been the pioneers in bringing cutting edge equipment and services to the industry. They were the first BEE company to venture into this industry and it is only fitting that they were chosen to partner with VTEQ (Spain) in this venture. The Moosagie's serves on various transport related committees and are supported by a strong managerial team.

Over and above testing equipment and accessories our area of expertise was extended to the complete accreditation of vehicle test stations. Today, we can design and build your test station, equip it with the latest equipment, find and employ staff, do all your accreditation, and even run the testing station for you if you so desire.

## **The Latest Technology**

Our latest brake testers compares to the best available equipment in the world and communicates via a LAN system where software has been integrated reporting the data straight to the device. This saves time and in transport time equals money.

With the new machine we are able to measure and check all brake efficiencies, reaction times of wheels, air pressures, and quality of drums, drag and imbalances between left and right wheels on the same axle. Everything on the brake testers is done electronically to reduce the possibility of human error.

We have already fitted all the machines with remote controls.
